Double Post Installation

Two rooks are used for each galvanized pipe. Be sure to install both rooks on the post before driving the post into the ground.

They slide over the pipe and are fastened with stainless steel screws after the post is driven into the ground.

Mark a heavy line on the pole to indicate where ground level will be and how far the pipe needs to be driven into the ground.

Drive the pole into the ground so your marked line is level with the ground.

Adjust your rooks and fasten them to the post with the screws provided.

Slide both vinyl sleeves onto the post then insert bottom rail into the first sleeve. The bottom rail can be inserted into the opposite sleeve by raising the sleeve up while inserting the rail.

Insert your sign.

Insert top rail.

Insert the plastic rivets into the sleeve to secure the rails.

Congratulations! You have just completed your PVC Double Post Kit Installation.
